the Playtest

Use Case

- **Student Based (Our core design)**
 - Raise Hand
 - Ask Question
 - Answer/Talk
 - Answer Questions with Leaning
- **Teacher**
 - Ask Question
 - Answer Question
 - Accept Hand Raise

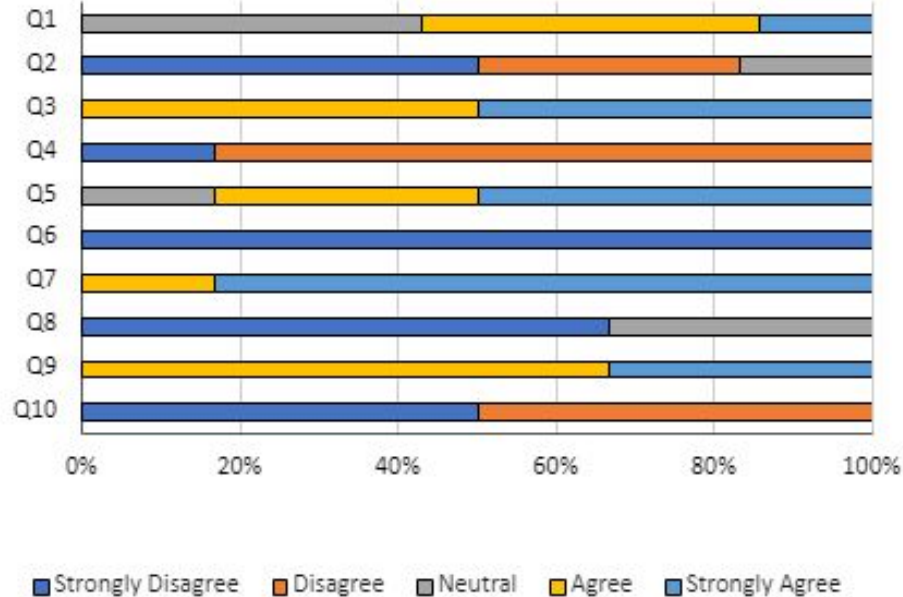

Demo

<https://www.youtube.com/watch?v=xulbVLupsiM>

System Usability Scale Analysis

- 85.4% SUS Score average
- Most of the points off came from users who:
 - Were not very interested in using the system frequently
 - Found it unnecessarily complex
 - Cumbersome to use

Our Thoughts

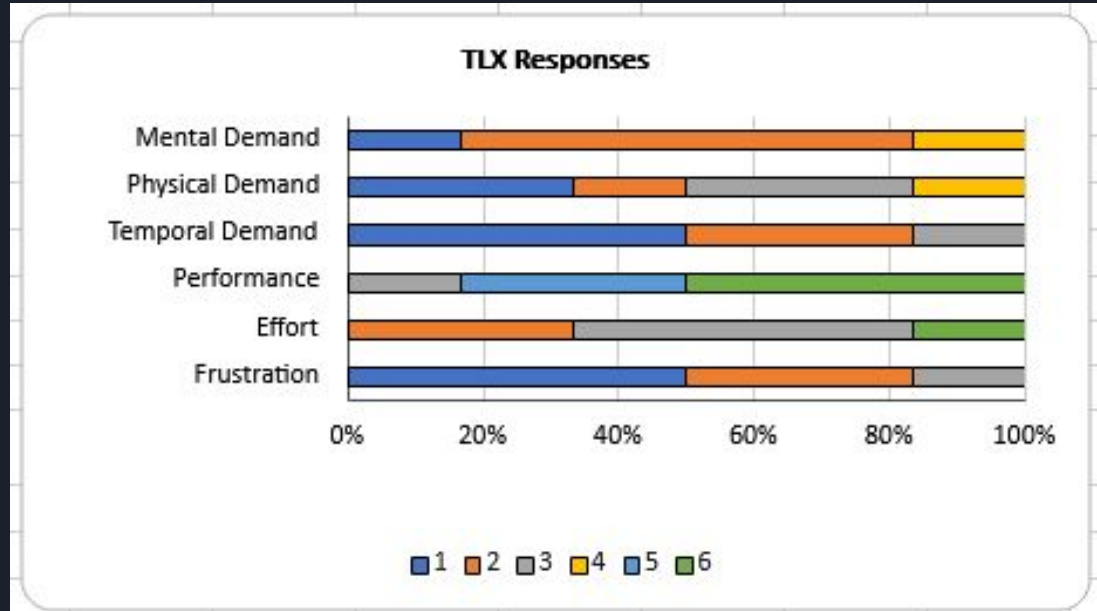

- Strong overall performance in the other SUS categories
- Users especially thought the systems were well integrated

NASA TLX Analysis

- Lower end of Mental Demand
- Somewhat cumbersome and physically demanding
- Low Temporal Demand
- Strong Performance
- **Mixed Reviews** on Effort Required
- Limited Frustration

Our thoughts

- Head lean required too much effort
- Hard to maneuver the heavy headset
- Overall ran very well

PQ Analysis

- 70% of the interaction felt natural
- 85% positive on the interaction
- 60% on the quality (REVERSED)
 - Head lean affected the control experience
 - Made it harder to accomplish the task
 - Slight delay in understanding
- 80% ability to examine the environment
- 75% ability to adjust to the environment and tasks

Our Thoughts

- More of a developer test build
 - Interactions weren't fully taught to the player
- Head lean again was a problem
 - Distracting, heavy
- Overall pretty solid experience

Other Feedback Received

- Users were asked if they had any further questions, comments or concerns regarding the system and notes were taken.
- Convert head lean to nod or shake for a more natural physical interaction.
- Reading text could be difficult, leading us to the potential of better fonts for accessibility.
- Confirm buttons may lapse immersion, but will decrease physical strain on the users.
- Functionality was impressive, and with a the strong base, few adjustments will be needed.

Limitations, Takeaways, and Future Work

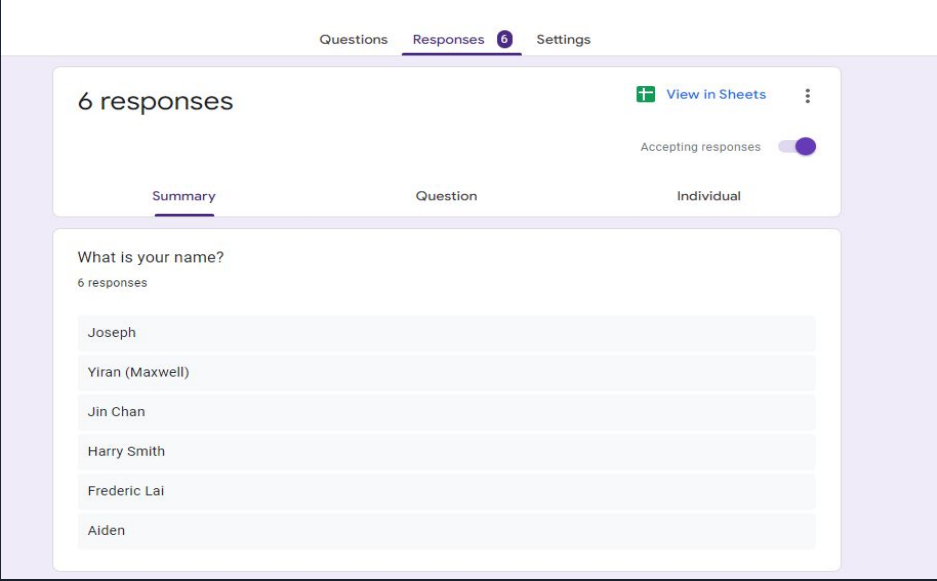

- Changes to scope regarding both teacher and student functionality.
- Developer build - Not truly set up for the user, had to explain
- Limited amount of data, with only 6 participants.
-
- The most important piece of information we learned was that our concept was more physically demanding than we originally thought.
 - Need to pivot to a head shake
 - Fix some text accessibility
- Refining the ability to interact with the world.
- Smooth physical movements to become more natural.

Appendices

Our Survey Link: <https://forms.gle/VJKCzPkaokuJWSgy5>

Responses Proof:

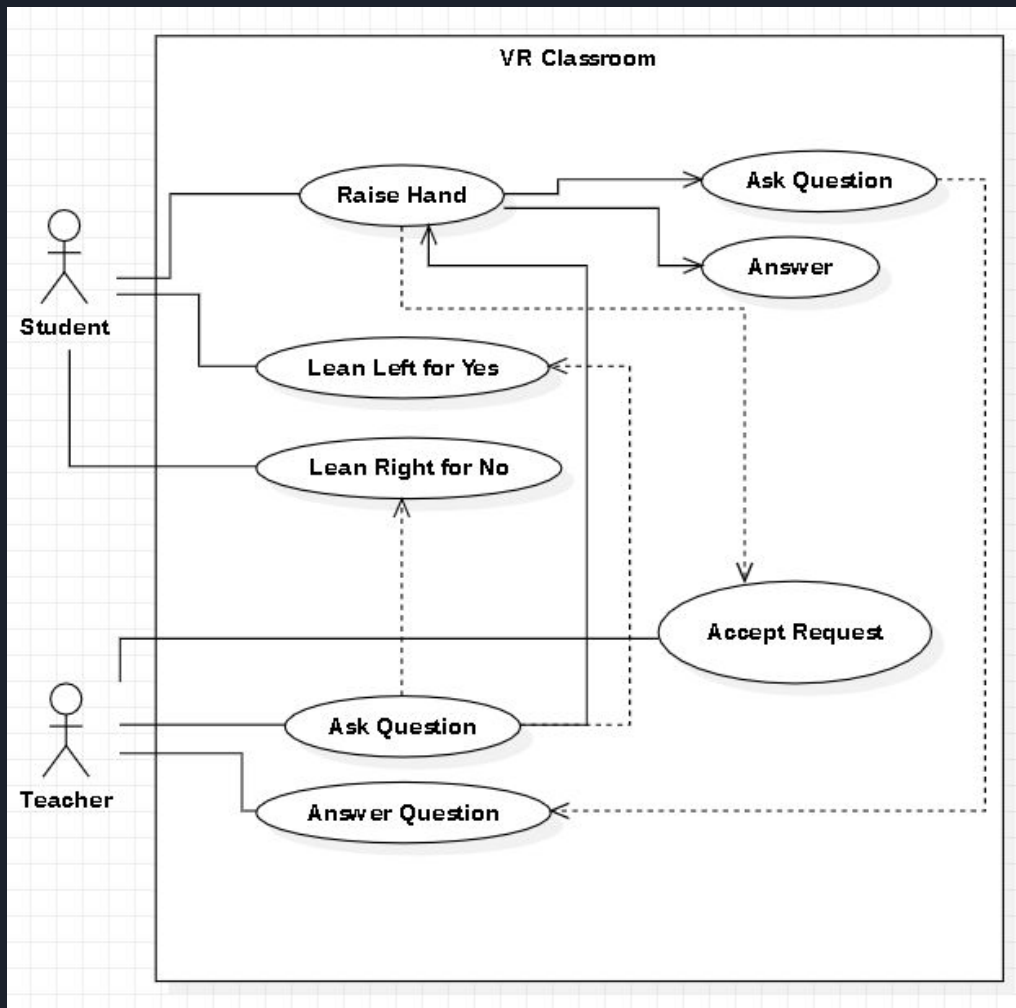

The screenshot displays the Google Forms interface for the 'Responses' tab. At the top, there are three tabs: 'Questions', 'Responses' (which is active and has a purple circle with the number 6), and 'Settings'. Below the tabs, the text '6 responses' is shown on the left, and on the right, there is a green plus icon with the text 'View in Sheets' and a vertical ellipsis menu. A toggle switch for 'Accepting responses' is also visible, currently turned on. Below this, there are three sub-tabs: 'Summary' (active), 'Question', and 'Individual'. The 'Summary' tab shows a list of responses for the question 'What is your name?'. The list includes the following names: Joseph, Yiran (Maxwell), Jin Chan, Harry Smith, Frederic Lai, and Aiden.

Question	Individual
What is your name?	Joseph
What is your name?	Yiran (Maxwell)
What is your name?	Jin Chan
What is your name?	Harry Smith
What is your name?	Frederic Lai
What is your name?	Aiden

Open Feedback (open Conversation after the user tested)

- Great progress and design so far
- Impressed with the quality and functionality of the prototype
- Hard to lean
 - Too far to lean
- Add text accessibility
- Add a confirm button
- Headset is heavy to lean with
